

## REF.: REAR AXLES

Our continuous testing and research has led us to develop new rear axles which are giving excellent results.

In order to help our customers to better understand the types we presently have, here below please find a list and a short description of the same:

- **Type F** = suitable to solve understeering problems. Harder than the standard type, but very flexible and elastic. Suitable with a lot of rubber on the track and hot conditions. (HRA 55°)
- **Type C** = harder than type F. It gives more grip to the rear. (HRA 62°)
- **Type C, 2mm thickness** = Same as above, but thinner (Ø 40 mm)
- **Standard type N** = soft type, This is the axle we usually mount on the kart as standard. Good with a little rubber on the track. (HRA 57°)
- **Standard type N, 2mm. thickness** = same as above, but thinner. Very good performance; be only informed that it can bend easily if there is a crash. (Ø 40 mm)

\*Type F, C and N axles are only available for Ø 40 and Ø 50mm.
